3.1.1 Numpy Array Operations

Problem Statement:

Write a Python program to create a NumPy array based on user input and display the following:

- ☐ The created NumPy array.
- ☐ The number of dimensions of the array using ndim
- ☐ The shape of the array using shape
- ☐ The total number of elements in the array using size

Assume all input elements are valid integers.

Input Format:

- ☐ The firstline contains two space-separated integers r and c, representing the numberofrows and the number of columns.
- ☐ The nextrlines contain c space-separated integers representing the elements of the array,entered row by row.

Output Format:

- ☐ The created NumPy array (printed as a 2D array).
- ☐ An integer representing the number of dimensions of the array.
- ☐ A tuple representing the shape of the array.
- ☐ An integer representing the total number of elements in the array.

Code:

```
import numpy as np
rows,cols = map(int, input().split())
elements = []

for _ in range (rows):
    elements.extend(map(int, input().split()))

array = np.array(elements).reshape(rows, cols)
print(array)
print(array.ndim)
print(array.shape)
print(array.size)
```

Output:

Average time
0.039 s
39.00 ms

Maximum time
0.056 s
56.00 ms

3.2.1 Numpy: Matrix Operations

Problem Statement:

The given code takes two 3×3 matrices, matrix_a, and matrix_b, as input from the user and converts them into NumPy arrays.

Task:

You are required to compute and display the results of the following matrix operations:

1. Addition (matrix_a + matrix_b)
2. Subtraction (matrix_a – matrix_b)
3. Element-wise Multiplication (matrix_a * matrix_b)
4. Matrix Multiplication (matrix_a · matrix_b)
5. Transpose of Matrix A

Input Format:

- The user will input 3 rows for matrix_a, each containing 3 integers separated by spaces.
- Similarly, the user will input 3 rows for matrix_b, each containing 3 integers separated by spaces.

Output Format:

The program should display the results of the operations in the following order:

1. The result of Addition.
2. The result of Subtraction.
3. The result of Element-wise Multiplication.
4. The result of Matrix Multiplication.
5. The Transpose of Matrix A.

Code:

```
import numpy as np
```

```
# Input matrices
```

```
print("Enter Matrix A:")
```

```
matrix_a = np.array([list(map(int, input().split())) for i in range(3)])
```

```
print("Enter Matrix B:")
```

```
matrix_b = np.array([list(map(int, input().split())) for i in range(3)])
```

```
# Addition
```

```
addition_result = matrix_a + matrix_b
```

```
print("Addition (A + B):")
```

```
print(addition_result)
```

```

# Subtraction
subtraction_result = matrix_a - matrix_b
print("Subtraction (A - B):")
print(subtraction_result)

# Multiplication (element-wise)
elementwise_multiplication_result = matrix_a * matrix_b
print("Element-wise Multiplication (A * B):")
print(elementwise_multiplication_result)

# Matrix multiplication (dot product)
matrix_multiplication_result = np.dot(matrix_a, matrix_b)
print("A dot B:")
print(matrix_multiplication_result)

# Transpose
transpose_a = matrix_a.T
print("Transpose of A:")
print(transpose_a)

```

Output:

0.000 s 0.000 s 2 out of 2 epochs (max) passed	
Test case 1 Request output Matrix A (4x4): [[1, 2, 3, 4], [[5, 6, 7, 8], [[9, 10, 11, 12], [[13, 14, 15, 16]]	Actual output Matrix A (4x4): [[1, 2, 3, 4], [[5, 6, 7, 8], [[9, 10, 11, 12], [[13, 14, 15, 16]]
Matrix B (4x4): [[1, 2, 3, 4], [[5, 6, 7, 8], [[9, 10, 11, 12], [[13, 14, 15, 16]]	Matrix B (4x4): [[1, 2, 3, 4], [[5, 6, 7, 8], [[9, 10, 11, 12], [[13, 14, 15, 16]]
Subtraction (A - B): [[0, 0, 0, 0], [[0, 0, 0, 0], [[0, 0, 0, 0], [[0, 0, 0, 0]]	Subtraction (A - B): [[0, 0, 0, 0], [[0, 0, 0, 0], [[0, 0, 0, 0], [[0, 0, 0, 0]]

Matrix Multiplication (A dot B): [[30, 74, 118, 162], [[67, 154, 239, 326], [[104, 238, 372, 506], [[141, 321, 505, 639]]	Matrix Multiplication (A dot B): [[30, 74, 118, 162], [[67, 154, 239, 326], [[104, 238, 372, 506], [[141, 321, 505, 639]]
Transpose of A: [[1, 5, 9, 13], [[2, 6, 10, 14], [[3, 7, 11, 15], [[4, 8, 12, 16]]	Transpose of A: [[1, 5, 9, 13], [[2, 6, 10, 14], [[3, 7, 11, 15], [[4, 8, 12, 16]]

3.2.2 Numpy: Horizontal and Vertical Stacking of Arrays

Problem Statement:

You are given two arrays arr1 and arr2. You need to perform horizontal and vertical stacking operations on them using NumPy.

- ☐ Horizontal Stacking: Stack the two matrices horizontally (side by side).
- ☐ Vertical Stacking: Stack the two matrices vertically (one below the other).

Input Format:

- ☐ The program should first prompt the user to input two 3x3 arrays.
- ☐ Each array consists of 3 rows, and each row contains 3 space-separated integers.
- ☐ The user will input the two arrays row by row.

Output Format:

- ☐ The program should display the result of the Horizontal Stack (side-by-side stacking) of the two arrays.
- ☐ The program should then display the result of the Vertical Stack (one below the other) of the two arrays.

Code:

```
import numpy as np
```

```
# Input matrices
```

```
print("Enter Array1:")
```

```
arr1 = np.array([list(map(int, input().split())) for i in range(3)])
```

```
print("Enter Array2:")
```

```
arr2 = np.array([list(map(int, input().split())) for i in range(3)])
```

```
# Perform horizontal stacking (hstack)
```

```
a = np.hstack((arr1, arr2))
```

```
print("Horizontal Stack:")
```

```
print(a)
```

```
# Perform vertical stacking (vstack)
```

```
b = np.vstack((arr1, arr2))
```

```
print("Vertical Stack:")
```

```
print(b)
```

Output:

3.2.3 Numpy: Custom Sequence Generation

Problem Statement:

Write a Python program that takes the following inputs from the user:

- Start value: The starting point of the sequence.
- Stop value: The sequence should end before this value.
- Step value: The increment between each number in the sequence.

The program should then generate a sequence using numpy based on these inputs and print the generated sequence.

Input Format:

- The user will input three integer values: start, stop, and step, each on a new line.

Output Format:

- The program should print the generated sequence based on the input values.

Code:

```
import numpy as np
# Take user input for the start, stop, and step of the sequence
start = int(input())
stop = int(input())
step = int(input())
# Generate the sequence using np.arange()
a = np.arange(start, stop, step)
# Print the generated sequence
print(a)
```

Output:

The screenshot displays a code execution interface with the following details:

- Performance Metrics:**
 - Average time: 0.039 s (39.00 ms)
 - Maximum time: 0.044 s (44.00 ms)
- Test Results:**
 - 2 out of 2 shown test case(s) passed
 - 2 out of 2 hidden test case(s) passed
- Test Case 1:**
 - Expected output: 3, 10, 2, [3 5 7 9]
 - Actual output: 3, 10, 2, [3 5 7 9]
- Test Case 2:**
 - Expected output: 10, 20, 30, [10]
 - Actual output: 10, 20, 30, [10]

3.2.4 Numpy: Arithmetic and Statistical Operations, Mathematical Operations and Bitwise Operators

Problem Statement:

You are given two arrays A and B. Your task is to complete the function `array_operations`, which will convert these lists into NumPy arrays and perform the following operations:

1. Arithmetic Operations:

- Compute the element-wise sum, difference, and product of the two arrays.

2. Statistical Operations:

- Calculate the mean, median, and standard deviation of array A.

3. Bitwise Operations:

- Perform bitwise AND, bitwise OR, and bitwise XOR on the arrays (ex: $A_i \text{ OR } B_i$).

Input Format:

- The first line contains space-separated integers representing the elements of array A.
- The second line contains space-separated integers representing the elements of array B.

Output Format:

- For each operation (arithmetic, statistical, and bitwise), print the results in the specified format as shown in sample test cases.

Code:

```
import numpy as np
```

```
def array_operations(A, B):
    # Convert A and B to NumPy arrays
    A = np.array(A)
    B = np.array(B)

    # Arithmetic Operations
    sum_result = A + B
    diff_result = A - B
    prod_result = A * B

    # Statistical Operations
    mean_A = np.mean(A)
    median_A = np.median(A)
    std_dev_A = np.std(A)
```

```
# Bitwise Operations
```

```
and_result = A & B
```

```
or_result = A | B
```

```
xor_result = A ^ B
```

```
#Output results with one space between each element
```

```
print("Element-wise Sum:", ' '.join(map(str, sum_result)))
```

```
print("Element-wise Dierence:", ' '.join(map(str, di_result)))
```

```
print("Element-wise Product:", ' '.join(map(str, prod_result)))
```

```
print(f"Mean of A: {mean_A}")
```

```
print(f"Median of A: {median_A}")
```

```
print(f"Standard Deviation of A: {std_dev_A}")
```

```
print("Bitwise AND:", ' '.join(map(str, and_result)))
```

```
print("Bitwise OR:", ' '.join(map(str, or_result)))
```

```
print("Bitwise XOR:", ' '.join(map(str, xor_result)))
```

```
A=list(map(int, input().split())) # Elements of array A
```

```
B=list(map(int, input().split())) # Elements of array B
```

```
array_operations(A, B)
```

O utput:

Average time: 0.036 s, 35.67 ms | Maximum time: 0.043 s, 43.00 ms | 1 out of 1 shown test case(s) passed | 2 out of 2 hidden test case(s) passed

3.2.5 Numpy: Copying and Viewing Arrays

Problem Statement:

The given code takes a list of integers as input and converts it into a NumPy array. Your task is to complete the code by:

- Creating a view of the original_array and assigning it to view_array.
- Creating a copy of the original_array and assigning it to copy_array.

After completing these steps, observe how modifying the view affects the original_array, while modifying the copy does not.

Input Format:

- A single line of space-separated integers.

Output Format:

- After modifying the view:
Original array after modifying view: <original_array>
View array: <view_array>
- After modifying the copy:
Original array after modifying copy: <original_array>
Copy array: <copy_array>

Code:

```
import numpy as np
inputlist = list(map(int,input().split(" ")))

# Original array
original_array = np.array(inputlist)

# Create a view
view_array = original_array.view()

# Create a copy
copy_array = original_array.copy()

# Modify the view
view_array[0] = 99
print("Original array after modifying view:", original_array)
print("View array:", view_array)

# Modify the copy
copy_array[1] = 88
```

```
print("Original array after modifying copy:", original_array)
print("Copy array:", copy_array)
Output:
```

3.2.6 Searching, Sorting, Counting, Broadcasting

Problem Statement:

The given code in the editor takes a single array, `array1`, as space-separated integers as input from the user.

Additionally, it takes the following inputs:

- `search_value`: The value to search for in the array.
- `count_value`: The value to count its occurrences in the array.
- `broadcast_value`: The value to add for broadcasting across the array.

You need to complete the code to perform the following operations:

1. Searching: Find the indices where `search_value` appears in `array1` and print these indices.
2. Counting: Count how many times `count_value` appears in `array1` and print the count.
3. Broadcasting: Add `broadcast_value` to each element of `array1` using broadcasting, and print the resulting array.
4. Sorting: Sort `array1` in ascending order and print the sorted array.

Input Format:

1. A singleline containing space-separated integers representing `array1`.
2. An integer `search_value` represents the value to search for in the array.
3. An integer `count_value` represents the value to count in the array.
4. An integer `broadcast_value` represents the value to add to each element of the array.

Output Format:

1. The indices where `search_value` occurs in `array1`.
2. The count of occurrences of `count_value` in `array1`.
3. The array after adding the `broadcast_value` to each element.
4. The sorted array.

Code:

```
import numpy as np
```

```
# Input array from the user
```

```
array1 = np.array(list(map(int, input().split())))
```

```
# Searching
```

```
search_value = int(input("Value to search: "))
```

```
count_value = int(input("Value to count: "))
```

```
broadcast_value = int(input("Value to add: "))
```

```
# Find indices where value matches in array1
a = np.where(array1 == search_value)[0]
print(a)
```

```
# Count occurrences in array1
b = np.count_nonzero(array1 == count_value)
print(b)
```

```
# Broadcasting addition
c = array1 + broadcast_value
print(c)
```

```
# Sort the first array
d = np.sort(array1)
print(d)
Output:
```

3.2.7 Student Data Analysis and Operations

Problem Statement:

Write a Python program that takes the file name of a CSV file containing student details, including roll numbers and their marks in three subjects as input, reads the data, and performs the following operations:

- ❑ Print all student details: Display the complete details of all students, including roll numbers and marks for all subjects.
- ❑ Find total students: Determine the total number of students in the dataset.
- ❑ Print all student roll numbers: Extract and print the roll numbers of all students.
- ❑ Print Subject 1 marks: Extract and print the marks of all students in Subject 1.
- ❑ Find minimum marks in Subject 2: Identify the lowest marks in Subject 2.
- ❑ Find maximum marks in Subject 3: Identify the highest marks in Subject 3.
- ❑ Print all subject marks: Display the marks of all students for each subject.
- ❑ Find totalmarks of students: Compute the total marks for each student across all subjects.
- ❑ Find the average marks of each student: Compute the average marks for each student.
- ❑ Find average marks of each subject: Compute the average marks for all students in each subject.
- ❑ Find average marks of Subject 1 and Subject 2: Compute the average marks for Subject 1 and Subject 2.
- ❑ Find average marks of Subject 1 and Subject 3: Compute the average marks for Subject 1 and Subject 3.
- ❑ Find the roll number of the student with maximum marks in Subject 3: Identify the student with the highest marks in Subject 3 and print their roll number.
- ❑ Find the roll number of the student with minimum marks in Subject 2: Identify the student with the lowest marks in Subject 2 and print their roll number.
- ❑ Find the roll number of students who scored 24 marks in Subject 2: Identify students who obtained exactly 24 marks in Subject 2 and print their roll numbers.
- ❑ Find the count of students who got less than 40 marks in Subject 1: Count the number of students who scored less than 40 marks in Subject 1.
- ❑ Find the count of students who got more than 90 marks in Subject 2: Count the number of students who scored more than 90 marks in Subject 2.
- ❑ Find the count of students who scored ≥ 90 in each subject: Count the number of students who scored 90 or more marks in each subject.

- Find the count of subjects in which each student scored ≥ 90 : Determine how many subjects each student scored 90 or more marks in.
- Print Subject 1 marks in ascending order: Sort and print the marks of students in Subject 1 in ascending order.
- Print students who scored between 50 and 90 in Subject 1: Display students who scored marks between 50 and 90 in Subject 1.
- Find index positions of students who scored 79 in Subject 1: Identify the index positions of students who scored exactly 79 marks in Subject 1.

Code:

```
import numpy as np
```

```
a = np.loadtxt("Sample.csv", delimiter=',', skiprows=1)
```

```
roll = a[:, 0].astype(float)
```

```
s1 = a[:, 1]
```

```
s2 = a[:, 2]
```

```
s3 = a[:, 3]
```

```
# 1. Print all student details
```

```
print("All student Details:\n", a)
```

```
# 2. print total students
```

```
print("Total Students:", len(a))
```

```
# 3. Print all student Roll numbers
```

```
print("All Student Roll Nos", roll)
```

```
# 4. Print subject 1 marks
```

```
print("Subject 1 Marks", s1)
```

```
# 5. print minimum marks of Subject 2
```

```
